

It Pays to Solve the Resource and Capacity Dilemma

Findings from the 2014 State of Resource Management and Capacity Planning Report

PLANVIEW®

Higher maturity organizations significantly reduce the most common resource management pain points:

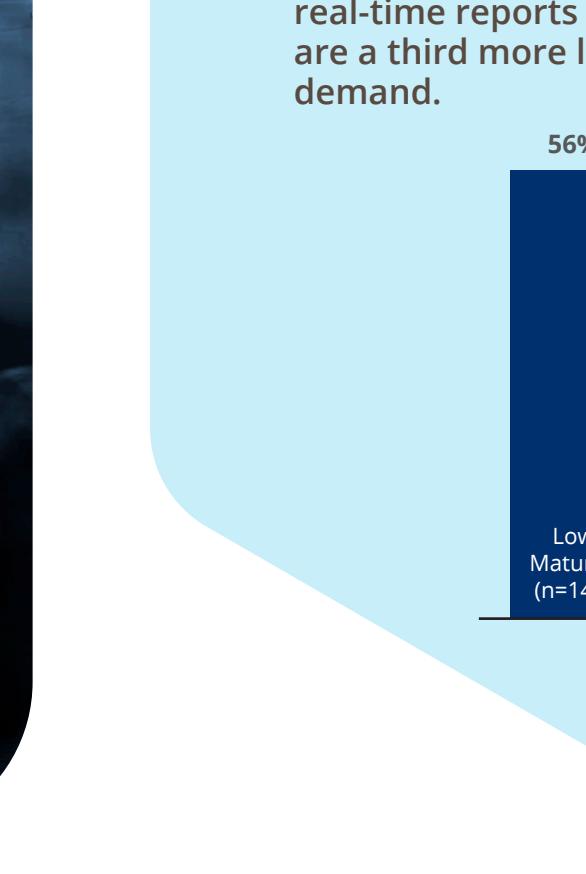

Insufficient visibility into resource capacity

Only 10% of higher maturity companies have an issue with visibility into resource capacity. Most lower maturity companies express this as a significant pain point.

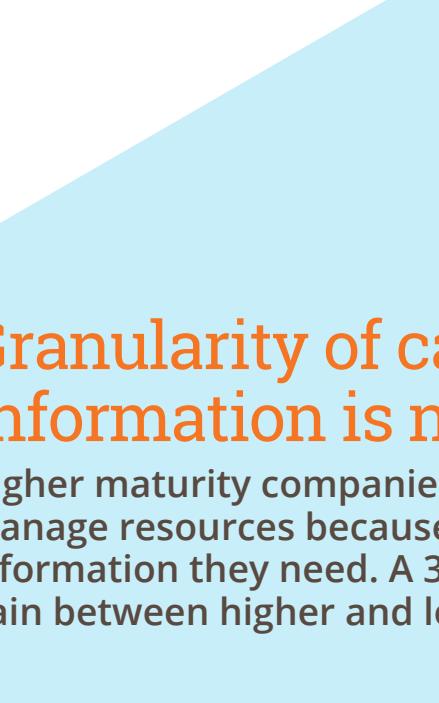

Over-committed resources

Higher maturity companies are 37% less likely to experience the pain and business impact of over-committing resources.

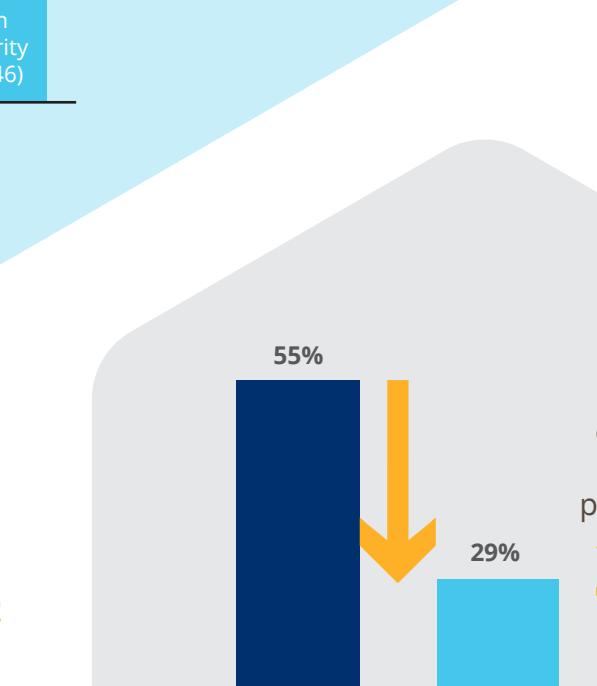

Lack of a combined, holistic view of both resource capacity and pipeline demand

Most early maturity companies lack a holistic view into resource capacity and pipeline demand. Companies at higher maturity are 53% more likely to have a comprehensive view, making them more agile and better able to optimize resources.

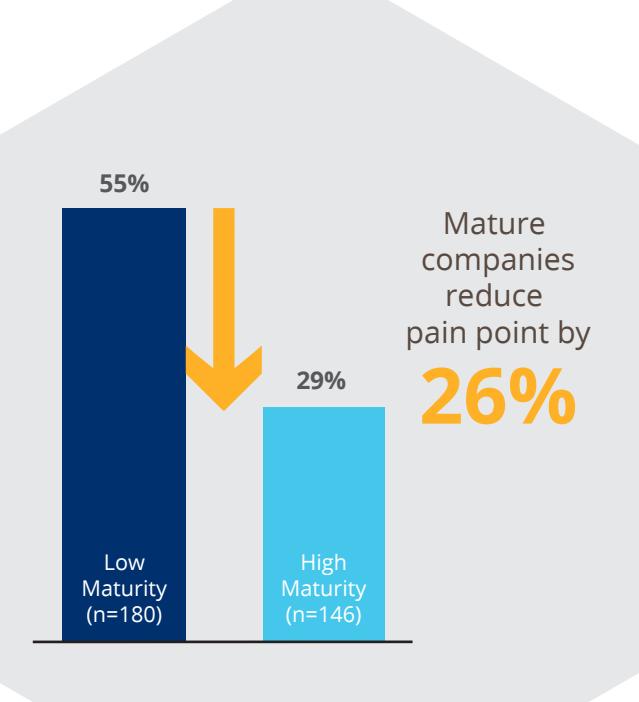

Inability to access real-time reports on resources

Lower maturity companies have difficulty accessing real-time reports on their resources. Top performers are a third more likely to have data available on demand.

Inaccurate resource estimates

More than half of early maturity companies struggle with accuracy of their resource estimates, whereas 27% of higher maturity companies report this pain point.

Granularity of capacity or resource information is not sufficient

Higher maturity companies are better able to plan and manage resources because they have the granularity of information they need. A 38% difference exists on this pain between higher and lower maturity companies.
